

LOW VISION CLINICAL DRIVING ASSESSMENT

DO YOU?

- Get distracted easily
- Fail to recognize dangerous situations
- Have difficulty judging space
- Drive too slowly
- Have difficulty making turns
- Get scrapes or dents on car, garage, mailbox, etc.
- Have multiple collisions in past 5 years
- Have multiple traffic violations in past 5 years

Driving is a complex task involving more than just your vision. Vision, memory, attention, reaction time, problem solving, and motor skills all influence our safety and independence behind the wheel. We provide a driving assessment in a risk free environment using STISIM® Driving Simulator so that you can know your risk of collision before getting behind the wheel. While the simulator is able to simulate various driving conditions, it DOES NOT replace a behind the wheel assessment. Upon completion of the Clinical Driving Assessment, appropriate recommendations will be given tailored to the patient and their needs. We strongly encourage all patients to follow up with the Department of Motor vehicles for a behind the wheel assessment prior to resuming driving.
